

Abstract of the Disclosure

The invention relates to a device for closing bags by means of plastic closing elements (2) which are linked by connecting pins, thereby forming a plate and can be individually and successively separated producing a closing strip directed to a supplying channel (25). Said closing elements are provided with a cracked orifice on one side thereof and placed on the neck of the bag rushed by clamping elements (3) with the aid of the forming punch which is provided with a support for receiving the closing elements (2). Said invention is characterised in that the forming punch (5) is connected to a separating matrix (4) and the supplying channel (25) is arranged on the plane of the closing strip, said plane being perpendicular with respect to the sliding plane of the punch and matrix (4, 5).
